

ABSTRACT OF THE DISCLOSURE

Remote control access over certain electronic devices through computer networks is disclosed. Particularly, an internet protocol (IP) interfacing apparatus for controlling non IP-based network devices with IP-based network devices and a method therefor is disclosed. The IP interfacing apparatus according to the present invention includes a dynamic home page assisting section for collecting information on the predetermined electronic devices to assist in construction and processing of a dynamic home page in accordance with assistance in construction of a dynamic web server, and a function control converting section for converting a function control demand by the IP-based networks to a function control of the non IP-based networks by converting a predetermined function selected through HTTP in said IP-based networks to a control command in said non IP-based network .
